UAF is looking for participants in a Canine Cognitive Dysfunction (CCD) Study

Does your dog get disoriented easily, have a recent change in behavior, abnormal sleeping cycle, bathroom related issues, or other signs of dementia? The University of Alaska Fairbanks is looking for dogs ages 8-11, weighing between 22 and 65 pounds, who may have mild to moderate cognitive decline.

What to expect:

Eligible dogs participating in this study will have two veterinary exams with cognitive testing, bloodwork, and MRI of the brain. These costs are paid for by the study.

Talk with your veterinarian or scan the QR code to learn more about CCD and the UAF study.

Contact Dr. Greg Pietsch, gpietsch@alaska.edu or 907-474-1838, for further details.
